INTRODUCTION

Two grab samples and a composite sample of the Ohio Valley Coal discharge channel (Perkins Run) waters were collected by Randy D. Spencer, DSW, SEDO, Ohio EPA for investigative purposes relating to its possible impact on Captina Creek. Perkins Run is almost entirely Ohio Valley Coal effluent comprised mainly of Pond 013 and slurry impoundment effluents. The Perkins Run samples were collected just prior to its introduction into Captina Creek. A grab sample was also collected from Captina Creek, upstream from Perkins Run. The Perkins Run samples were collected on 21 July 2008 at 1130 hours and on 22 July 2008 at 1200 hours. The composite sample was collected on 21-22 July 2008 between 1143-1143 hours. The Captina Creek upstream water was collected on 22 July 2008 at 1200 hours. A mixing zone sample was manually prepared in the field by combining equal aliquots of Captina Creek upstream water and Perkins Run water on 21 July 2008 at 1130 hours. The fathead minnow, *Pimephales promelas*, and *Ceriodaphnia dubia* were used as test organisms in these 48-hour screening bioassays.

PREVIOUS RESULTS

Bioassays of Ohio Valley Coal outfall 001 effluents were previously conducted by the Ohio EPA within the last ten years in October 2004 (Bioassay Number 04-3089-SE). The previously tested effluents were not acutely toxic to either *P. promelas* or *C. dubia* (Appendix 1).

RESULTS AND CONCLUSIONS

Details of the tests may be found on the attached bioassay report forms. The effluents were acutely toxic to *Ceriodaphnia*. Daphnid mortality was 10, 85, 45, and 30 percent in the manual mixing zone, 21 and 22 July Perkins Run waters, and the Perkins Run composite sample, respectively. Additional *C. dubia* pale in appearance was 10 percent in the 22 July Perkins Run water and Perkins Run composite sample. Fathead minnow mortality ranged from 5 to 10 percent in the Perkins Run samples. Survival in the laboratory controls was 95 percent or greater for both species.

Screening bioassays are utilized to determine if an effluent is acutely toxic to the test organisms and to indicate if more extensive bioassays should be conducted to estimate median lethal concentrations or persistence of toxicity. The results of these bioassays indicate that Ohio Valley Coal discharge channel (Perkins Run) was acutely toxic to *C. dubia*. Additional bioassays should be conducted to better determine the magnitude of toxicity in Perkins Run downstream from the Ohio Valley Coal Pond 013 and impoundment effluents.

These tests did not address the possibility of chronic toxicity. Discharge data for Ohio Valley Coal discharge channel (Perkins Run) water and the Captina Creek should be evaluated to determine if chronic toxicity is of concern. Chronic tests may be required to adequately evaluate the possibility of toxicity in this discharge.

OHIO ENVIRONMENTAL PROTECTION AGENCY
Screening Bioassay Report Form

Report Date: 25 July 2008	**Bioassay Report Number**: 08-3801-SE

Investigators:	Jonathan C. McLaughlin, G. Duane Davis, and Clarissa R. Lawlis

Effluent tested and source:	Ohio Valley Coal discharge channel, 56854 Pleasant Ridge Road, Alledonia, Belmont County, Ohio
NPDES Number:	OH0012661
Ohio EPA Permit Number:	0IL00046*DD
Business/Process:	
Collector(s):	Randy D. Spencer, DSW, SEDO, Ohio EPA

Test Organisms:	Fathead minnow (*Pimephales promelas*) and *Ceriodaphnia dubia* from Ohio EPA Bioassay Section rearing units

Fathead Minnow Data:	n = 20. Number of fish used in estimating mean standard length and mean weight

	Mean	Standard Deviation	Range
Standard Length (millimeters):	6.1	0.51	5.5-7.0
Weight (milligrams):	1.0	0.38	0.5-1.7

Hatched: 11-12 July 2008; 10-11 days old at test initiation

Rearing unit water and reconstituted water were used in the controls for this static bioassay. Adverse effects measured in the test are death, immotility, and loss of equilibrium. Death is the cessation of all visible movement with no response to gentle prodding (fish) or to gentle test container agitation (*Ceriodaphnia*). An immotile organism is paralyzed or stunned with only occasional slight movements and cannot maintain its normal position in the water column. Loss of equilibrium is the organism's inability to maintain normal swimming posture in the water column and may be characterized by periods of quiescence followed by bursts of uncontrolled swimming. The effluent is considered to be acutely toxic if 20 percent, or more, of either species of test organism exhibits any combination of the adverse effects in the 100 percent effluent. Test results are invalid if more than ten percent of either species of test organism exhibits the adverse effects in the control.

Results of screening bioassays of Ohio Valley Coal discharge channel (Perkins Run) effluent

Bioassay Number: 08-3801-SE

Sample	Time Collected Date: Time: (hours)	Test Start Date: Time: (hours)	Cumulative percent mortality (plus those pale in appearance)			
			P. promelas Time (hours)		*C. dubia* Time (hours)	
			24	48	24	48
Captina Creek upst. Perkins Run	22 July 2008 1130	22 July 2008 1535	0	0	0	0
Manual mixing zone (1:1)	21 July 2008 1130	22 July 2008 1535	0	0	0	10
Perkins Run Grab	21 July 2008 1130	22 July 2008 1535	0	5	10	85

Perkins Run Composite	21-22 July 2008 1143-1143	22 July 2008 1535	0	10	0	30 (40)
Rearing unit water control		22 July 2008 1535	5	5	-	-
Reconstituted water control		22 July 2008 1535	-	-	0	0

Relevant information: A mixing zone sample was manually prepared in the field by combining equal aliquots of upstream water and effluent. Perkins Run is almost entirely Ohio Valley Coal effluent comprised mainly of Pond 013 and slurry impoundment effluents. The Perkins Run samples were collected just prior to its introduction into Captina Creek. The Captina Creek upstream water was clear with a yellow tinge. The manual mixing zone and composite effluent were amber. The 21 July Perkins Run grab was amber/brown. The 22 July Perkins Run grab was clear yellow. All samples contained settleable solids. After warming to the 25°C test temperature, all field samples were shaken vigorously for approximately 15 seconds to release supersaturated dissolved oxygen. Physicochemical parameters measured prior to test initiation and at test end are on the next page.

Results of screening bioassays of Ohio Valley Coal discharge channel (Perkins Run) effluent

Bioassay Number: 08-3801-SE

Relevant information (cont.): Physicochemical parameters recorded prior to test initiation were:

Sample	Temperature (°C)		Dissolved Oxygen (mg/L)	pH	Conductivity
	Upon Rcpt.	Test Init.	Initial-Adjusted	(S.U.)	(µmhos/cm)
Captina Creek upst. Perkins Run	7.9	24.9	9.2-8.6	7.93	493
Manual mixing zone (1:1)	7.0	25.4	9.5-8.5	7.87	3070
Perkins Run Grab, 21 July 2008	6.6	24.8	9.7-8.5	7.80	5380
Perkins Run Grab, 22 July 2008	7.4	24.5	9.2-8.3	7.82	6140
Perkins Run Composite	8.2	25.0	9.3-8.2	7.86	5820
Rearing unit water control	22.9	24.5	8.2	7.92	340
Reconstituted water control	25.4	25.4	7.9	7.98	560

Physicochemical parameters recorded at *P. promelas* (FHM) and *C. dubia* (CDU) test end were:

Sample	Temperature (°C)		Dissolved Oxygen (mg/L)		pH (S.U.)		Conductivity (µmhos/cm)

2014-00657203781

Definitions

- The **LC50s** and **EC50s** are reported as percent by volume effluent (%).
- The **LC50** is the effluent concentration that is lethal to 50 percent of a species of test organism in a stated exposure period. The **EC50** includes mortality plus data on other adverse effects. Both are usually obtained by statistical or graphical methods.
- The **TUa** is calculated by dividing 100 by the **LC50** or **EC50**.

OHIO EPA, DES, BIOASSAY SECTION, SAMPLE SUBMISSION FORM

Name of Entity and Outfall Tested: Ohio Valley Coal Co. 013+ Slurry Impoundment **OEPA Permit #:** ϕILϕϕϕ46* DD

Facility Address: 56834 Pleasant Ridge Ave. Alledonia OH **NPDES #:** OH ϕϕ12661

Receiving Stream (R.M.) Captina Creek @ Rm 22.4 (+ mouth of Perkins Run) **County:** Belmont

Collector(s) [Print Full Name]: Randy D Spencer

Collector(s) Signature: Randy D Spencer

Upstream control samples shall be collected upstream from any discharge/receiving stream interactions. Generally, acute (near field) samples should be collected in the center of the effluent plume 5 times the stream depth downstream from the outfall and chronic (far field) samples should be collected midplume, or if a plume no longer exists midstream 5 times the stream width downstream from the outfall. If atypical mixing characteristics exist, samples can be collected at closer distances than the above guidelines to insure the samples are within the effluent plume. If a mixing zone sample cannot be safely collected, one can be prepared using equal aliquots of the day 1 effluent grab and upstream dilution water (be sure to write "manual" in the "Location of Sample Collection" space provided below).

CHEMISTRY SAMPLE NUMBERS
103509-12

Location Map Drawing

Describe and map the upstream control and any mixing zone sampling sites so someone else could sample at the exact same points (include landmarks if possible). Stream depth should be recorded for any acute (near field) mixing zone sample and stream width for any chronic (far field) mixing zone sample. For the mixing zone sample location, delineate the distance downstream from the outfall and map the effluent plume. Be specific on discharge and receiving stream characteristics.

Field Comments

Lab Comments

QC / Sample Comments 625: Acid extractable compounds estimated due to poor acid surrogate recoveries. Acenaphthene, Anthracene, 4-chloro-3-methylphenol, 2-chlorophenol, 2,4-dichlorophenol, 2,4-dimethylphenol, pentachlorophenol, and 2,4,6-trichlorophenol estimated due to poor matrix spike recovery.

Approved By SROBERTS **On** 08/08/2008
